

The Department of Psychology, Centre
of Psychoanalysis invites to a lecture
by

**Professor Mark Solms, Department of Psychology,
University of Cape Town, South Africa:**

‘Clinical Implications of Neuropsychanalysis’

September 21, 2017, at 14-16,

CSS, room 1.1.18, Øster Farimagsgade 5

Professor Solms will describe the basic brain mechanisms that are involved in psychopathology, and, based on this, he will outline and explain the brain mechanisms of common psychotherapeutic and psychopharmacological treatments. He will discuss how and why psychotherapy works, and how it differs (neurologically) from drug therapy. Lastly, he will address the question: how well do these treatments work and what does this mean for psychoanalysis?

Solms founded the International Neuropsychanalysis Society in 2000 and was a Founding Editor (with Ed Nersessian) of the journal *Neuropsychanalysis*. He has published widely in both neuroscientific and psychoanalytic journals, including [Cortex \(journal\)](#), [Neuropsychologia](#), [Trends in Cognitive Sciences](#) and [Behavioral and Brain Sciences](#). He has published more than 250 articles and book chapters, and 6 books. His book (with Oliver Turnbull), "The Brain and the Inner World" has been translated into 13 languages.

Faculty, students and others with interest in the theme of “Brain, psychopathology and psychotherapy” are welcome

Mvh
Bent Rosenbaum
Overlæge, dr med, Psykiatrisk Center København
Adj Professor, Psykologisk Institut, Københavns Universitet
